## 1 9/5 PDE terminology & philosophy

PDE: equation for a multivariate function that involves its partial derivatives.

Example:  $u_y = x$ . Example:  $(yu)_y = 1$ .

General solution of a PDE.

Formally: PDE:  $F(u, x_i, u_{x_i}, u_{x_ix_i}, ...) = 0$ 

Order of a pde

Linear PDE.

Linear homogeneous PDE.

What are the order and linearality of the following PDEs?  $u_x + u_{yyx} = 1$ ,  $uu_x + u = 0$ ,  $u_x + (x^2 + y^2)u_{yy} = 1$ .

Some PDEs we will focus on later:

Heat:  $u_t = u_{xx}$ : (heat transmission, diffusion)

Laplace:  $u_{xx} + u_{yy} = 0$ : (static electric field, Newton's gravity, equilibrium of random walk)

Wave:  $u_{tt} = u_{xx}$ : (sound wave, other waves in physics)

Other important linear PDEs:

Dispersive wave equations:  $u_{tt} = u_{xx} - ku_{xxxx}$  (stiff string) Cauchy-Riemann equation:  $u_x = v_y$ ,  $u_y = -v_x$ 

Non-linear PDEs you may see in later classes:

Navier-Stokes

Nonlinear Schrodinger:  $iu_t = -\Delta u + k|u|^2u$ 

KdV:  $u_t + u_{xxx} + 6uu_x = 0$ , etc.

Example: growth of bacteria. Baseline: GMCF (geodesic mean curvature flow)  $u_t = A \frac{\nabla u}{|\nabla u|} \cdot \nabla u + B|\nabla u|\nabla \cdot \frac{\nabla u}{|\nabla u|}$ .

Types of problems:

Evolution model (with time): Boundary condition. Initial condition. Initial value problem. Initial-boundary value problem.

Steady state model (no time): boundary value problem.

Typical questions in the theory of PDE:

Existence

Uniqueness

Regularity

Continuous dependency on boundary

Typical strategy: integral transform:  $(Tu)(y) = \int u(x)K(x,y)dx$ , then  $T(u_x) = \int u_x(x)K(x,y)dx = -\int u(x)K_x(x,y)dx$ , assume some decay conditions on the boundary (or infinity).

Problem: Is such a transform well defined?

Connection with harmonic analysis.

Use of symmetry (method of mirror images, spherical symmetry etc.) Example: solve  $u_{xx} + u_{yy} = 1$ , where u = 0 on the unit circle.

Example:  $u_x = u_t$ ,  $u_x = u_t + 1$ .

## 2 9/7 Review of ODE, Advection and Diffusion

Review of ODE & multivatiable calculus topics:

- $\bullet \ u' + p(t)u + q(t) = 0$
- $\bullet \ u''' + Au'' + Bu' + Cu = 0$
- Chain rule: Example:  $u_{xx} = u_{tt}$ , what happens with change-of-variable u = x + t, v = x t?
- Fubini's theorem. Derivative and integration. Example:  $u_{tt} = u_{xx} + u_{yy}$ ,  $u(x, y, t) = \sin(x \cos \theta + y \sin \theta + t)$  are solutions, hence  $\int_0^{2\pi} \sin(x \cos \theta + y \sin \theta + t) d\theta$  is also a solution.
