#### 1 9/5 PDE terminology & philosophy

PDE: equation for a multivariate function that involves its partial derivatives.

Example:  $u_y = x$ . Example:  $(yu)_y = 1$ .

General solution of a PDE.

Formally: PDE:  $F(u, x_i, u_{x_i}, u_{x_ix_i}, ...) = 0$ 

Order of a pde

Linear PDE.

Linear homogeneous PDE.

What are the order and linearality of the following PDEs?  $u_x + u_{yyx} = 1$ ,  $uu_x + u = 0$ ,  $u_x + (x^2 + y^2)u_{yy} = 1$ .

Some PDEs we will focus on later:

Heat:  $u_t = u_{xx}$ : (heat transmission, diffusion)

Laplace:  $u_{xx} + u_{yy} = 0$ : (static electric field, Newton's gravity, equilibrium of random walk)

Wave:  $u_{tt} = u_{xx}$ : (sound wave, other waves in physics)

Other important linear PDEs:

Dispersive wave equations:  $u_{tt} = u_{xx} - ku_{xxxx}$  (stiff string) Cauchy-Riemann equation:  $u_x = v_y$ ,  $u_y = -v_x$ 

Non-linear PDEs you may see in later classes:

Navier-Stokes

Nonlinear Schrödinger:  $iu_t = -\Delta u + k|u|^2u$ 

KdV:  $u_t + u_{xxx} + 6uu_x = 0$ , etc.

Example: growth of bacteria. Baseline: GMCF (geodesic mean curvature flow)  $u_t = A \frac{\nabla u}{|\nabla u|} \cdot \nabla u + B|\nabla u|\nabla \cdot \frac{\nabla u}{|\nabla u|}$ .

Types of problems:

Evolution model (with time): Boundary condition. Initial condition. Initial value problem. Initial-boundary value problem.

Steady state model (no time): boundary value problem.

Typical questions in the theory of PDE:

Existence

Uniqueness

Regularity

Continuous dependency on boundary

Typical strategy: integral transform:  $(Tu)(y) = \int u(x)K(x,y)dx$ , then  $T(u_x) = \int u_x(x)K(x,y)dx = -\int u(x)K_x(x,y)dx$ , assume some decay conditions on the boundary (or infinity).

Problem: Is such a transform well defined?

Connection with harmonic analysis.

Use of symmetry (method of mirror images, spherical symmetry etc.) Example: solve  $u_{xx} + u_{yy} = 1$ , where u = 0 on the unit circle.

Example:  $u_x = u_t$ ,  $u_x = u_t + 1$ .

### 2 9/7 Review of ODE, Advection and Diffusion

Review of ODE & multivatiable calculus topics:

- $\bullet \ u' + p(t)u + q(t) = 0$
- u''' + Au'' + Bu' + Cu = 0
- Chain rule: Example:  $u_{xx} = u_{tt}$ , what happens with change-of-variable y = x + t, w = x t?
- Fubini's theorem.
- Differentiating an integral. Example:  $\frac{d}{dt} \int_0^{t^2} \sin(ts) ds$ . Solution: Let x = t, y = t, then  $\frac{d}{dt} \int_0^{t^2} e^{-ts^2} ds = \frac{d}{dt} \int_0^{x^2} e^{-ys^2} ds = (\int_0^{x^2} e^{-ys^2} ds)_x + (\int_0^{x^2} e^{-ys^2} ds)_y = 2x \cdot e^{-y(x^2)^2} + \int_0^{x^2} (e^{-ys^2})_y ds = 2x e^{-y(x^2)^2} - \int_0^{x^2} s^2 e^{-ys^2} ds = 2t e^{-t^5} - \int_0^{t^2} s^2 e^{-ts^2} ds$ .
- Example:  $u_{tt} = u_{xx} + u_{yy}$ ,  $u(x, y, t) = \sin(x \cos \theta + y \sin \theta + t)$  are solutions, hence  $\int_0^{2\pi} \sin(x \cos \theta + y \sin \theta + t) d\theta$  is also a solution.

PDE from conservation laws, 1-dimensional case:

Consider the flow of some material whose total quantity remain unchanged, along a thin tube with section area A(x). Then, conservation means:

$$\frac{d}{dt} \int_a^b u(x,t)A(x)dx = A(a)\phi(a,t) - A(b)\phi(b,t) + \int_a^b f(x,t)A(x)dx$$

 $\phi$ : flux. f: source.

Differentiate w.r.t. b one gets:  $Au_t = -A\phi_x - A'\phi + fA$ .

- $\phi = u$ : e.g. cars which travels at the same speed, age distribution etc.
- $\phi = -u_x$ : heat conduction etc.
- $\phi = u u_x$ : contaminated flow etc.
- f = -u: decay.

Relationship with random motion: see  $u(\cdot,t)$  as the probability distribution.

Example:  $u_t = u_x - u$ . Decay vs. "widening".

Example: u has two components (e.g. mass, momentum): wave equation.

#### 3 9/12 Method of characteristics

Question: first order linear PDE in 2 dimension:  $u_t + fu_x + gu + h = 0$ 

First consider the case when g = h = 0. Recall that for 1st order ODE, there is a concept of first integral: the solution of  $x'F_x + F_t = 0$  are the level curves of F(x,t). Hence, the level curves of u are exactly the solutions of u' = t, which are called *characteristics*.

Example:  $u_t = xu_x - u$ .

Example:  $u_t = u_x + u_y$ .

Example:  $u_t = \sin t u_x + 1$ .

Non-linear advection:  $u_t = f(u)u_x$ : level curves are straight lines of slope f(c). Breaking time.

Example:  $u_t = (1 - u)u_x$ .

#### $4 ext{ } 9/14 ext{ Diffusion, fundamental solutions}$

Review of method of characteristics:  $u_t + cu_x = x$ .

Fick's law:  $\phi = -Du_x$ , which results in  $u_t = Du_{xx}$ . Simple observation:

- 1. Steady state solution: u = ax + b.
- 2. Loss of information: should study initial value problem:  $u_t = u_{xx}$ , u(x,0) = f(x) on region t > 0.
- 3. Time scale: remains unchanged under  $t = c^2t'$ , x = cx'.
- 4. Conservation of the "total heat":  $\int u dx$  remain unchanged.

One could expect solution whose "shape" remain unchanged as one scales as in (3). However the integral in (4) changes under this scaling, so one should expect a factor of  $t^{-1/2}$ . Let  $u=t^{-1/2}v(x^2/t)$ , then v can be chosen as  $v=Ce^{-s/4}$ . One can normalize it into  $u=\frac{1}{4\pi Dt}e^{-x^2/4t}$ .

This is called the fundamental solution of heat equation in one dimension.  $\delta$  distribution.

Alternative interpretation of the fundamental solution: discretize, then use central limit theorem. General solution: Convolution.

Fundamental solution of heat equations in higher dimensions?

 $u_t = u_x + u_{xx}$ 

Method of mirrors: IBV problem.

#### 5 9/18 Wave equation

$$u_{tt} = u_{rr}$$

Model 1: String vibration:  $u_{tt}$  proportional to force which is characterized by  $u_{xx}$ .

Model 2: Sound wave in 1-dimension:  $\rho_t = -(\rho v)_x$ ,  $(\rho v)_t = -(\rho v^2)_x - p_x$ ,  $p = k\rho^{\gamma}$ .

Review: general solution.

Solution for initial value problem.

Sound speed.

Initial-boundary value problems with one boundary (mirror), initial-boundary value problems with 2 boundaries, periodicity.

(Optional) Sepherical waves in higher dimensions.

# 6 9/21 Wave equation, boundary conditions, review of multivariable calculus

Correction: derivation of the general solution of 1-D wave equation:

$$u_{tt} = c^2 u_{xx}$$

$$(\partial_t + c\partial_x)(\partial_t - c\partial_x)u = 0$$

$$(\partial_t + c\partial_x)u = f(x+ct)$$

$$u = G_1(x-ct) + \int_o^t f(cs + (x-ct) + cs)ds$$

$$F_1' = f$$

$$u = G_1(x-ct) + (F_1(x+ct) - F_1(x-ct))/c = (G_1 - F_1/c)(x-ct) + (F_1/c)(x+ct)$$

Now let  $G = G_1 - F_1/c$ ,  $F = F_1/c$ .

Boundary conditions: Dirichlet, Neumann, Robin.

Homogeneous boundary condition.

Example:  $u_{tt} = u_{xx}$ , u(0,t) = 0,  $u_X(1,t) = 0$ , general solution?

Example: non-homogeneous boundary and non-homogeneous equations

Example:  $u_{tt} = u_{xx} + \sin x$ .

Vector field in 3 dimension:  $T: \mathbb{R}^3 \to \mathbb{R}^3$ . grad, div and curl. Stokes theorem in  $\mathbb{R}$ ,  $\mathbb{R}^2$ ,  $\mathbb{R}^3$ .

## $7 ext{9/26}$ Heat equation in high dimension, Laplace equation

Mass balance in high dimension:  $u_t + div\phi = 0$ . Heat:  $\phi = -kgrad(u)$ .

Steady-state: Laplace equation.

Maximal principle, uniqueness.

Example of solutions. Fundamental solution.

Variational principle.

\*\*\*\*\*

Laplacian in sepherical coordinates. Sepherical harmonics.

#### 8 9/28 Types of PDEs

Consider 2nd order equation  $Au_{xx}+Bu_{xy}+Cu_{yy}+f(u,u_x,u_y,x,y)=0$ . It is called elliptic/parabolic/hyperbolic iff  $Ax^2+Bxy+Cy^2$  is positive or negative definite/degenerate/indefinite.

Canonical forms:  $u_{xx} + u_{yy} + \cdots = 0$ ,  $u_{xy} + \cdots = 0$ ,  $u_{xx} + \cdots = 0$ 

Example: different types at different places.

Example: type remains unchanged under coordinate change: polar coordinate.

#### 9 10/3 Heat equation

Formula for the Green's function/fundamental solution G(x,t).

Properties:  $\int_{-\infty}^{\infty} G(x,t) dx = 1$ ,  $\lim_{t\to 0^+} \int_{|x|>c>0} G(x,t) dx = 0$ ,  $G_t = kG_{xx}$ .

Poisson integration formula: is a solution: linearality; initial condition: the properties above.

Non-uniqueness of the solution: Tychonov 1935

Higher dimension.

Theorem (Poisson integration): If f is a bounded continuous function, then a solution of  $u_t = ku_{xx}$  when t > 0, u(x, 0) = f(x) is:

$$u = \int_{\mathbb{R}} f(y)G(x - y, t)dy$$

Proof: By computation we know that:

- $1. \int_{\mathbb{R}} G(x,t) dx = 1$
- 2. For any c > 0,  $\int_{x \notin [-c,c]} G(x,t) dx \to 0$  as  $t \to 0$ .
- 3.  $G_t = kG_{xx}$

 $u_t = ku_{xx}$  follows from 3. and the fact that all infinite integrals involves converges absolutely. Now we need to show the initial condition, i.e. that  $u(x,t) \to f(x)$  as  $t \to 0^+$ . Let M be a bound of |f(x)|.

For any c > 0,

$$|u(x,t)-f(x)|$$

$$\leq |\int_{x-c}^{x+c} f(x)G(x-y,t)dy - f(x)| + |\int_{x-c}^{x+c} (f(y)-f(x))G(x-y,t)dy| + |\int_{y \notin [x-c,x+c]} f(y)G(x-y,t)dy|$$

$$\leq |f(x)\int_{y \notin [-c,c]} G(y,t)dy| + \sup_{x-c < y < x+c} |f(y)-f(x)| + M|\int_{y \notin [-c,c]} G(y,t)dy|$$

Now, for any  $\epsilon > 0$ , let c be small enough so that  $\sup_{x-c < y < x+c} |f(y) - f(x)| < \epsilon/2$ , t be small enough so that  $|\int_{y \notin [-c,c]} G(y,t) dy| < \epsilon/4M$ , then  $|u(x,t) - f(x)| < \epsilon$ . Hence  $u(x,t) \to f(x)$  as  $t \to 0$ . Furthermore, because any continuous function is absolutely continuous when restricted to a bounded closed neighborhood, the convergence is uniform when x is restricted to any bounded interval. Hence u is continuous on t = 0.

#### 10 10/5 Examples, Poisson problem for wave equation

$$u_t = u_{xx}, \ u(x,0) = \chi_{[-1,1]}$$
 
$$u_t = u_{xx}, \ u(x,0) = e^{-x^2}$$
 
$$erf \text{ function: } erf(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

d'Alembert from change of variable:  $u_{tt} = k^2 u_{xx}$ , p = x + kt, q = x - kt, then  $u_{pq} = 0$ , u = F(p) + G(q). Now u(x,0) = f(x),  $u_t(x,0) = g(x)$ , which in p,q-coordinate means F(x) + G(x) = f, kF'(x) - kG'(x) = 0. Solve for F and G then one gets the d'Alembert formula.

Negative and positive characteristics, domain of influence and domain of dependence

#### 11 Review for Midterm I

The following may appear in the first midterm:

- Simplify PDE by substitution
- Prove properties of the solution by chain rules, fundamental theorem of calculus, and divergence theorem
- Solve PDE by reducing it to ODE either through restriction to a curve or through the use of symmetry.
- Obtain particular solution from the general solution by applying boundary condition.
- Method of characteristics
- General solution of 1-dimensional wave equations
- Poisson integration representation for initial value problem of the heat equation
- Can recognize elliptic, parabolic and hyperbolic 2nd-order equations

#### Practice problems:

- 1. Solve the initial value problem  $u_t + \sin t u_x = 1$ ,  $u(x,0) = \sin x$ .
- 2. Find the steady state solution of  $u_t = u_{xx} + xu_x$ .
- 3. Consider the equation:  $u_{tt} = u_{xx} + u_{yy}$ . If a solution satisfy  $u = \sin tv(x, y)$ , what is the PDE v satisfies? Can you find a solution when v depends only on y?
- 4. Consider the boundary value problem  $u_{tt} = u_{xx} u_t$ , u(0,t) = u(1,t) = 0. Show that the function  $\int_0^1 u_t^2 + u_x^2$  is decreasing. What's the limit of u as  $t \to \infty$ ?

#### 12 10/10 Well posed problem, review

Some known solutions of IVP:

- $u_t = u_x$ , u(x, 0) = f(x)Answer: u(x, t) = f(x + t).
- $u_{tt} = u_{xx}$ , u(x,0) = f(x),  $u_t(x,0) = g(x)$ Answer:  $u(x,t) = \frac{1}{2}(f(x+t) + f(x-t)) + \frac{1}{2}\int_{x-t}^{x+t} g(s)ds$ .
- $u_t = u_{xx}, \ u(x,0) = f(x), \ u \text{ bounded. } (\text{or } \leq Ce^{Cx^2})$ Answer:  $u(x,t) = \int_{\mathbb{R}} f(s)G(x-s)ds.$

In all cases, we have: (1) solution exist. (2) solution is unique. (3) solution depends on the initial condition continuously. Hence we call them **well posed** problems.

Example of non-well-posed problems:

Nonlinear advection.

Reverse heat equation.

$$u_{xx} + u_{tt} = 0.$$

Review:

1. 
$$u_t = tu_x$$
,  $u(x,0) = x^2$ .

2.  $u_{tt} = u_{xx} - u$ : steady state? General solution?
